I saw Him, sitting on His throne, surrounded by a myriad of cherubim and seraphim. He was surrounded by everything I need to know - safety, truth, peace, and love. My eyes sat in a daze for several minutes, as I continued to gaze at the image of Christ in all His divine glory. I began to hear Him speak to me. It seemed as if He were telling me something very important and as if He were speaking to my heart, mind and soul. "Love, love, love." "Do you not know that Love is perfected in you?" And He continued, "Some people think of love as a longing for a relationship, but in reality it is a relationship." "The Father and I and the Son, and the Holy Spirit." As I heard Him, I began to weep, and I could feel the Lord wrapping His arms

around me. As I wept, He told me that the reason He was weeping with me was to comfort me. "I love you," He said. I began to wonder what He would say. What would He tell me? What would He tell me to do? Would He tell me that I am His child? His child whom He loves with an everlasting love? His beloved? His lovable? His highly favored? He continued to speak to me. As I listened, I became aware that He was speaking to me in all His glory. He was addressing me just like any person would. "But I am not

In general, it will take multiple instances of "good" and "bad" areas to have a chain of communications, all of whose links can be traced back to a criminal. * In the case of an RMS attack, even that distance is too short. That is, you'd have to throw signals at the right spot, at the right time, and with the right frequency, to cover all the data space, and that is very difficult. Not so, according to Bhatt. His technique, using five different frequencies (one for each letter of the alphabet), would allow the attacker to pinpoint a single message and get a decent readout. In data communications, digital data is typically transmitted in the form of a data stream of serial bits. In a typical prior art digital data transmission

system, transmitter and receiver systems each includes a clock and data recovery circuit and a modulator/demodulator circuit. The transmitter clock and data recovery circuit synchronizes the receiver clock and data using a clock synchronization signal. The transmitter clock and data recovery circuit in the receiver system compares a received bit stream with the clock synchronization signal and synchronizes the incoming data stream according to the clock synchronization signal. In a typical digital data transmission system, there are certain bits of the data bit stream that are in a data transition that occurs during the transmission of the data stream. For example, there may be a transition that occurs in the middle of a bit. After the bit is received, if the subsequent bits of the incoming data stream are all "1"s, for example, they may be written to a memory in the receiver system. These subsequent data bits, which are all of the same value, are said to be in a burst. In order to determine if the received bits are in a data transition, data is typically written into a register and subsequently read from 6d1f23a050
